

AI-BFSI Internship Project Documentation

Team Involvement in Demonstration – Subscription Waste Detector

1. Introduction

The **Subscription Waste Detector** was developed as an **individual project** under the **AI Specialist BFSI Program**. Although this document is titled “*Team Involvement in Demonstration*”, the entire lifecycle—including planning, requirement analysis, design, implementation, testing, documentation, and final demonstration—was carried out by a single developer.

In typical projects, demonstration responsibilities are distributed among team members. In this case, all technical and presentation responsibilities were managed individually, ensuring that every implemented feature was showcased in a logical sequence.

2. Purpose of the Demonstration

The demonstration aimed to:

- Present the completed application
- Showcase implemented features
- Explain the financial problem addressed
- Validate alignment with project objectives
- Demonstrate AI integration via Groq API
- Provide evaluators with a clear understanding of the workflow

3. Individual Responsibility Overview

Demonstration Activity	Responsibility
Project Planning	Developer
Problem Statement Explanation	Developer
Requirement Analysis	Developer
System Design Explanation	Developer
Solution Architecture Presentation	Developer
Application Development	Developer
Feature Demonstration	Developer
AI Integration Explanation	Developer
Testing Demonstration	Developer
Documentation Preparation	Developer
Final Project Presentation	Developer
Q&A Session	Developer

4. Demonstration Responsibilities

- **Project Introduction:** Overview of objectives and financial problem
- **Problem Statement:** Explanation of recurring subscription challenges
- **Solution Overview:** Architecture and workflow using Streamlit, Python, Pandas, Plotly, Groq API
- **Live Demonstration:** CSV/Excel upload, manual entry, subscription detection, dashboard, charts, reminders, AI recommendations
- **Feature Explanation:** How each feature contributes to solving the problem
- **Technical Architecture:** Interaction between modules and AI service
- **AI Integration:** Distinction between ChatGPT (development assistant) and Groq API (application feature)
- **Testing Demonstration:** Show correct operation of implemented features
- **Documentation Overview:** Present supporting reports and lifecycle documentation

5. Demonstration Workflow

6. Demonstration Resources

Resource	Purpose
----------	---------

Streamlit Application	Live demonstration
Visual Studio Code	Development environment
Google Chrome	Application execution
Sample CSV File	Expense analysis demonstration
Sample Excel File	Expense analysis demonstration
Groq API	AI recommendation generation
Project Documentation	Technical explanation and evaluation

7. Expected Demonstration Outcomes

- Application launches successfully
- Expense files processed correctly
- Recurring subscriptions identified
- Monthly spending displayed
- Plotly charts generated
- Renewal reminders shown
- AI recommendations produced via Groq API
- Workflow explained clearly to evaluators

8. Demonstration Challenges and Preparation

Preparations included:

- Verifying Python libraries
- Testing CSV/Excel uploads
- Validating subscription detection
- Confirming dashboard accuracy
- Checking Groq API connectivity
- Reviewing documentation consistency

9. Benefits of Individual Project Ownership

- Complete understanding of system architecture
- Full ownership of design and implementation decisions
- Consistent coding and documentation style
- Efficient issue resolution
- Ability to explain every feature confidently

10. Conclusion

Although titled “**Team Involvement in Demonstration**”, the Subscription Waste Detector was developed and demonstrated entirely by a single developer. All responsibilities—planning, coding, testing, documentation, and presentation—were independently managed.
